# 1 Introduction

Index

This file implements generic hooks for (arbitrary) commands. In theory every command  $\mbox{\sc name}$  offers now two associated hooks to which code can be added using  $\mbox{\sc AddToHookNext.}^1$  These are

cmd/ $\langle name \rangle$ /before This hook is executed at the very start of the command execution after its arguments (if any) are parsed. The hook  $\langle code \rangle$  is wrapped in the command inside a call to \UseHook{cmd/ $\langle name \rangle$ /before}, so the arguments passed to the command are *not* available in the hook  $\langle code \rangle$ .

<sup>\*</sup>This file has version v1.0b dated 2021/05/26, © LATEX Project.

<sup>&</sup>lt;sup>1</sup>In practice this is not supported for all types of commands, see section 2.2 for the restrictions that apply and what happens if one tries to use this with commands for which this is not supported.

cmd/\(\lame\)/after This hook is similar to cmd/\(\lame\)/before, but it is executed at the
very end of the command body. This hook is implemented as a reversed hook.

The hooks are not physically present before \begin{document} (i.e., using a command in the preamble will never execute them) and if nobody has declared any code for them, then they are not added to the command code ever. For example, if we have the following definition

```
\newcommand\foo[2]{Code #1 for #2!}
```

then executing  $foo\{A\}\{B\}$  will simply run  $Code_{\sqcup}A_{\sqcup}for_{\sqcup}B!$  as it was always the case. However, if somebody, somewhere (e.g., in a package) adds

```
\AddToHook{cmd/foo/before}{<before code>}
```

then, after \begin{document} the definition of \foo will be:

```
\renewcommand\foo[2]{\UseHook{cmd/foo/before}Code #1 for #2!}
```

and similarly \AddToHook{cmd/foo/after}{<after code>} alters the definition to

```
\renewcommand\foo[2]{Code #1 for #2!\UseHook{cmd/foo/after}}
```

In other words, the mechanism is similar to what etoolbox offers with \pretocmd and \apptocmd with the important differences

- that code can be prepended or appended (i.e., added to the hooks) even if the command itself is not defined, because the defining package has not yet been loaded
- and that by using the hook management interface it is now possible to define how
  the code chunks added in these places are ordered, if different packages want to
  add code at these points.

# 2 Restrictions and Operational details

Adding arbitrary material to commands is tricky because most of the time we do not know what the macro expects as arguments when expanding and TEX doesn't have a reliable way to see that, so some guesswork has to be employed.

## 2.1 Patching

The code here tries to find out if a command was defined with \newcommand or \DeclareRobustCommand or \NewDocumentCommand, and if so it assumes that the argument specification of the command is as expected (which is not fail-proof, if someone redefines the internals of these commands in devious ways, but is a reasonable assumption).

If the command is one of the defined types, the code here does a sandboxed expansion of the command such that it can be redefined again exactly as before, but with the hook code added.

If however the command is not a known type (it was defined with \def, for example), then the code uses an approach similar to etoolbox's \patchcmd to retokenize the command with the hook code in place. This procedure, however, is more likely to fail if the catcode settings are not the same as the ones at the time of command's definition, so not always adding a hook to a command will work.

#### 2.1.1 **Timing**

When \AddToHook (or its expl3 equivalent) is called with a generic cmd hook, say, cmd/foo/before, for the first time (that is, no code was added to that same hook before), in the preamble of a document, it will store a patch instruction for that command until \begin{document}, and only then all the commands which had hooks added will be patched in one go. That means that no command in the preamble will have hooks patched into them.

At \begin{document} all the delayed patches will be executed, and if the command doesn't exist the code is still added to the hook, but it will not be executed. After \begin{document}, when \AddToHook is called with a generic cmd hook the first time, the command will be immediately patched to include the hook, and if it doesn't exist or if it can't be patched for any reason, an error is thrown; if \AddToHook was already used in the preamble no new patching is attempted.

This has the consequence that a command defined or redefined after \begin{document} only uses generic cmd hook code if \AddToHook is called for the first time after the definition is made, or if the command explicitly uses the generic hook in its definition by declaring it with \NewHookPair adding \UseHook as part of the code.<sup>2</sup>

#### 2.2 Commands that look ahead

Some commands are defined in different "steps" and they look ahead in the input stream to find more arguments. If you try to add some code to the cmd/\(\lambda\)name\/after hook of such command, it will not work, and it is not possible to detect that programmatically, so the user has to know (or find out) which commands can or cannot have hooks attached to them.

One good example is the \section command. You can add something to the cmd/section/before hook, but if you try to add something to the cmd/section/after hook, \section will no longer work. That happens because the \section macro takes no argument, but instead calls a few internal IATEX macros to look for the optional and mandatory arguments. By adding code to the cmd/section/after hook, you get in the way of that scanning.

# 3 Package Author Interface

The cmd hooks are, by default, available for all commands that can be patched to add the hooks. For some commands, however, the very beginning or the very end of the code is not the best place to put the hooks, for example, if the command looks ahead for arguments (see section 2.2).

If you are a package author and you want to add the hooks to your own commands in the proper position you can define the command and manually add the \UseHook calls inside the command in the proper positions, and manually define the hooks with \NewHook or \NewReversedHook. When the hooks are explicitly defined, patching is not attempted so you can make sure your command works properly. For example, an (admittedly not really useful) command that typesets its contents in a framed box with width optionally given in parentheses:

\newcommand\fancybox{\@ifnextchar({\@fancybox}{\@fancybox(5cm)}}
\def\@fancybox(#1)#2{\fbox{\parbox{#1}{#2}}}

 $<sup>^{2}</sup>$ We might change this behavior in the main document slightly after gaining some usage experience.

If you try that definition, then add some code after it with

```
\AddToHook{cmd/fancybox/after}{<code>}
```

and then use the \fancybox command you will see that it will be completely broken, because the hook will get executed in the middle of parsing for optional (...) argument.

If, on the other hand, you want to add hooks to your command you can do something like:

then the hooks will be executed where they should and no patching will be attempted. It is important that the hooks are declared with \NewHook or \NewReversedHook, otherwise the command hook code will try to patch the command. Note also that the call to \UseHook{cmd/fancybox/before} does not need to be in the definition of \fancybox, but anywhere it makes sense to insert it (in this case in the internal \Offancybox).

Alternatively, if for whatever reason your command does not support the generic hooks provided here, you can disable a hook with \DisableHook<sup>3</sup>, so that when someone tries to add code to it they will get an error. Or if you don't want the error, you can simply declare the hook with \NewHook and never use it.

The above approach is useful for really complex commands where for one or the other reason the hooks can't be placed at the very beginning and end of the command body and some hand-crafting is needed. However, in the example above the real (and in fact only) issue is the cascading argument parsing in the style developed long ago in LATEX 2.09. Thus, a much simpler solution for this case is to replace it with the modern <code>NewDocumentCommand</code> syntax and define the command as follows:

```
\label{lem:decommand} $$ \D()_{5cm}_{\parbox{\{parbox{\#1},{\#2}\}}} $$
```

If you do that then both hooks automatically work and are patched into the right places.

# 4 The Implementation

# 4.1 Execution plan

To add before and after hooks to a command we will need to peek into the definition of a command, which is always a tricky thing to do. Some cases are easy because we know how the command was defined, so we can assume how its  $\langle parameter\ text\rangle$  looks like (for example a command defined with \newcommand may have an optional argument followed by a run of mandatory arguments), so we can just expand that command and make it grab #1, #2, etc. as arguments and define it all back with the hooks added.

Life's usually not that easy, so with some commands we can't do that (a #1 might as well be  $\#_{12}1_{12}$  instead of the expected  $\#_61_{12}$ , for example) so we need to resort to

<sup>&</sup>lt;sup>3</sup>Please use \DisableHook if at all, only on hooks that you "own", i.e., for commands that your package or class defines and not second guess whether or not hooks of other packages should get disabled!

"patching" the command: read its \meaning, and tokenize it again with \scantokens and hope for the best.

So the overall plan is:

- 1. Check if a command is of a known type (that is, defined with \newcommand<sup>4</sup>, \DeclareRobustCommand, or \New(Expandable)DocumentCommand), and if is, take appropriate action.
- 2. If the command is not a known type, we'll check if the command can be patched. Two things will prevent a command from being patched: if it was defined in a nonstandard catcode setting, or if it is an internal expl3 command with  $\__{\sim} \langle module \rangle$ in its name, in which case we refuse to patch.
- 3. If the command was defined in nonstandard catcode settings, we will try a few standard ones to try our best to carry out the pathing. If this doesn't help either, the code will give up and throw an error.

#### Variables 4.2

\g\_hook\_patch\_action\_list\_tl

Pairs of \if<cmd>..\patch<cmd> to be used with \robust@command@act when looking for a known patching rule. This token list is exposed because we see some future applications (with very specialized packages, such as etoolbox that may want to extend the pairs processed. It is not meant for general use which is why it is not documented in the interface documentation above.

```
6 \tl_new:N \g_hook_patch_action_list_tl
(End definition for \g hook patch action list tl.)
```

\l\_hook\_patch\_num\_args\_int The number of arguments in a macro being patched.

```
7 \int_new:N \l__hook_patch_num_args_int
(End definition for \l_hook_patch_num_args_int.)
```

\l\_\_hook\_patch\_prefixes\_tl \l\_hook\_patch\_param\_text\_tl \l hook patch replacement tl

The prefixes and parameters of the definition for the macro being patched.

```
8 \tl_new:N \l__hook_patch_prefixes_tl
9 \tl_new:N \l__hook_patch_param_text_tl
```

10 \tl\_new:N \l\_\_hook\_patch\_replacement\_tl

(End definition for \l\_hook\_patch\_prefixes\_t1, \l\_hook\_patch\_param\_text\_t1, and \l\_hook\_patch\_replacement\_tl.)

\g hook delayed patches prop

A list containing the patches delayed to \begin{document}, so that patching is not attempted twice.

```
11 \prop_new:N \g_hook_delayed_patches_prop
```

<sup>&</sup>lt;sup>4</sup>It's not always possible to reliably detect this case because a command defined with no optional argument is indistinguishable from a \defed command.

# 4.4 Patching or delaying

(End definition for \tl\_rescan:nV.)

\\_\_hook\_try\_put\_cmd\_hook:n
\\_\_hook\_try\_put\_cmd\_hook:w

Before \begin{document} all patching is delayed. This function is called from within \AddToHook, when code is added to a generic cmd hook is newly declared. It checks whether the patch position is valid, then proceeds to trying to patch or delaying to \begin{document} if in the preamble.

```
15 \cs_new_protected:Npn \__hook_try_put_cmd_hook:n #1
    { \_hook_try_put_cmd_hook:w #1 / / \s_hook_mark {#1} }
  \cs_new_protected:Npn \__hook_try_put_cmd_hook:w
18
       #1 / #2 / #3 / #4 \s_hook_mark #5
19
       \_hook_debug:n { \iow_term:n { ->~Adding~cmd~hook~to~'#2'~(#3): } }
20
       \str_case:nnTF {#3}
21
           { { before } { } { after } { } }
         { \exp_args:Nc \__hook_patch_cmd_or_delay:Nnn {#2} {#2} {#3} }
23
         { \msg_error:nnnn { hooks } { wrong-cmd-hook } {#2} {#3} }
24
25
(End definition for \_hook_try_put_cmd_hook:n and \_hook_try_put_cmd_hook:w.)
```

\\_hook\_patch\_cmd\_or\_delay:Nnn \\_hook\_cmd\_begindocument\_code: In the preamble, \\_\_hook\_patch\_cmd\_or\_delay:Nnn just adds the patch instruction to a property list to be executed later.

The delayed patches are added to a property list to prevent duplication, and the code stored in the property list for each key is executed. The function \\_\_hook\_patch\_cmd\_-or\_delay:Nnn is also redefined to be \\_\_hook\_patch\_command:Nnn so that no further delaying is attempted.

```
34 \cs_new_protected:Npn \__hook_cmd_begindocument_code:
35 {
36     \cs_gset_eq:NN \__hook_patch_cmd_or_delay:Nnn \__hook_patch_command:Nnn
37     \prop_map_function:NN \g__hook_delayed_patches_prop { \use_ii:nn }
```

\\_\_hook\_cmd\_try\_patch:nn

At \begin{document} tries patching the command if the hook was not manually created in the meantime. If the document does not exist, no error is raised here as it may hook into a package that wasn't loaded. Hooks added to commands in the document body still raise an error if the command is not defined.

```
\cs_new_protected:Npn \__hook_cmd_try_patch:nn #1 #2
44
    {
       \__hook_debug:n
45
         { \iow_term:x { ->~\string\begin{document}~try~cmd / #1 / #2. } }
46
         _hook_if_declared:nTF { cmd / #1 / #2 }
47
48
49
           \__hook_debug:n
             { \iow_term:n { .->~Giving~up:~hook~already~created. } }
50
51
        }
           \cs_if_exist:cT {#1}
53
             { \exp_{args:Nc \setminus_{hook\_patch\_command:Nnn {#1} {#1} {#2} }}
54
55
    }
56
```

 $(End\ definition\ for\ \verb|\__hook\_cmd\_try\_patch:nn.)$ 

# 4.5 Patching commands

\\_hook\_patch\_command:Nnn \\_hook\_patch\_check:NNnn \_hook\_if\_public\_command:N<u>TF</u> \\_hook\_if\_public\_command:w \\_\_hook\_patch\_command: Nnn will do some sanity checks on the argument to detect if it is possible to add hooks to the command, and raises an error otherwise. If the command can contain hooks, then it uses \robust@command@act to find out what type is the command, and patch it accordingly.

```
\cs_new_protected:Npn \__hook_patch_command:Nnn #1 #2 #3
58
        _hook_patch_debug:x { analyzing~'\token_to_str:N #1' }
59
      \_hook_patch_debug:x { \token_to_str:N #1 = \token_to_meaning:N #1 }
60
         _hook_patch_check:NNnn \cs_if_exist:NTF #1 { undef }
61
62
          \__hook_patch_debug:x { ++~control~sequence~is~defined }
63
          \_hook_patch_check:NNnn \token_if_macro:NTF #1 { macro }
64
65
              \__hook_patch_debug:x { ++~control~sequence~is~a~macro }
66
              \_hook_patch_check:NNnn \_hook_if_public_command:NTF #1 { expl3 }
                  \_hook_patch_debug:x { ++~macro~is~not~private }
                  \robust@command@act
                    \g_hook_patch_action_list_tl #1
71
                     \__hook_retokenize_patch:Nnn { #1 {#2} {#3} }
                }
            }
74
        }
```

and a conditional \\_\_hook\_if\_public\_command: N to check if a command has \_\_ in its name (no other checking is performed). Primitives with :D in their name could be included here, but they are already discarded in the \token\_if\_macro:NTF test above.

```
85
  \use:x
86
    {
       \prg_new_protected_conditional:Npnn
87
           \exp_not:N \__hook_if_public_command:N ##1 { TF }

 $(End\ definition\ for\ \verb|\__hook_patch_command:Nnn|\ and\ others.)$ 

#### 4.5.1 Patching by expansion and redefinition

 $\verb|\g_hook_patch_action_list_tl||\\$ 

This is the list of known command types and the function that patches the command hooks into them. The conditionals are taken from \ShowCommand, \NewCommandCopy and \\_\_kernel\_cmd\_if\_xparse:NTF defined in ltcmd.

(End definition for \g\_hook\_patch\_action\_list\_tl.)

\\_hook\_patch\_DeclareRobustCommand:Nnn

At this point we know that the commands can be patched by expanding then redefining. These are the cases of commands defined with \newcommand with an optional argument or with \DeclareRobustCommand.

With \\_hook\_patch\_DeclareRobustCommand:Nnn we check if the command has an optional argument (with a test counter-intuitively called \@if@newcommand). If so, we forward the action to \\_hook\_patch\_newcommand:Nnn, otherwise call the patching engine \\_hook\_patch\_expand\_redefine:NNnn with a \c\_false\_bool to indicate that there is no optional argument.

 $(End\ definition\ for\ \verb|\__hook_patch_DeclareRobustCommand:Nnn.|)$ 

\_hook\_patch\_newcommand:Nnn

If the command was defined with \newcommand and an optional argument, call the patching engine with a \c\_true\_bool to flag the presence of an optional argument, and with \\command to patch the actual code for \command.

```
117 \cs_new_protected:Npn \__hook_patch_newcommand:Nnn #1
118 {
119 \exp_args:NNc \__hook_patch_expand_redefine:NNnn \c_true_bool
120 { \c_backslash_str \cs_to_str:N #1 }
121 }
```

(End definition for \\_\_hook\_patch\_newcommand:Nnn.)

\\_\_hook\_cmd\_patch\_xparse:Nnn

And for commands defined by the xparse commands use this for patching:

```
122 \cs_new_protected:Npn \__hook_cmd_patch_xparse:Nnn #1
123 {
124 \exp_args:NNc \__hook_patch_expand_redefine:NNnn \c_false_bool
125 { \cs_to_str:N #1 ~ code }
126 }
```

(End definition for \\_\_hook\_cmd\_patch\_xparse:Nnn.)

\\_hook\_patch\_expand\_redefine:NNnn \\_hook\_make\_prefixes:w Now the real action begins. Here we have in #1 a boolean indicating if the command has a [...]-delimited argument, in #2 the command control sequence, in #3 the name of the command (note that  $\#1 \neq \c$ name $\#2\c$ name at this point!), and in #4 the hook position, either before or after.

```
127 \cs_new_protected:Npn \__hook_patch_expand_redefine:NNnn #1 #2 #3 #4
128 {
129 \__hook_patch_debug:x { ++~command~can~be~patched~without~rescanning }
```

We'll start by counting the number of arguments in the command by counting the number of characters in the  $\cs_argument_spec:N$  of the macro, divided by two, and subtracting one if the command has an optional argument (that is, an extra [] in its  $\langle parameter\ text \rangle$ ).

Now build two token lists:

- \l\_\_hook\_patch\_param\_text\_tl will contain the \( \text{parameter text} \) to be used when redefining the macro. It should be identical to the \( \text{parameter text} \) used when originally defining that macro.
- $\label{local_nook_patch_replacement_tl}$  will contain braced pairs of  $\#_{12}\langle num\rangle$  to feed to the macro when expanded. This token list as well as the previous will have the first item surrounded by [...] in the case of an optional argument.

```
\int_compare:nNnTF { \l_hook_patch_num_args_int } > { \c_zero_int }
135
         {
136
           \tl_set:Nx \l__hook_patch_param_text_tl
             { \bool_if:NTF #1 { [####1] } { ####1
138
           \tl_set:Nx \l__hook_patch_replacement_tl
139
             { \bool_if:NTF #1 { [####1] } { {####1} } }
140
           \int_step_inline:nnn { 2 } { \l__hook_patch_num_args_int }
               \tl_put_right:Nn \l__hook_patch_param_text_tl
                                                                   { ## ####1 }
               \tl_put_right:Nn \l__hook_patch_replacement_tl { { ## ###1 } }
145
         }
146
147
           \tl_clear:N \l__hook_patch_param_text_tl
148
           \tl_clear:N \l__hook_patch_replacement_tl
149
150
```

Finally, before redefining, we need to also get the prefixes used when defining the command. Here we ensure that the \escapechar is printable, otherwise a macro defined with prefixes \protected \long will have it \meaning printed as protectedlong, making life unnecessarily complicated. Here the \escapechar is changed to /, then we loop between pairs of /.../ extracting the prefixes.

Now that all the needed tools are ready, without further ado we'll redefine the command #2. The definition uses the prefixes gathered in \l\_hook\_patch\_prefixes\_tl, a primitive \tex\_def:D to avoid adding extra prefixes, and the \(\lambda parameter \text\rangle\) from \l\_hook\_patch\_param\_text\_tl.

Then finally, in the body of the definition, we insert cmd/#3/before if #4 is before, the code of the command expanded once grabbing the parameters in \l\_hook\_patch\_-replacement\_tl, and cmd/#3/after if #4 is after.

Here's the auxiliary that makes the prefix control sequences for the redefinition. Each item has to be \tl\_trim\_spaces:n'd because the last item (and not any other) has a trailing space.

 $(End\ definition\ for\ \_\ hook\_patch\_expand\_redefine:NNnn\ and\ \_\ hook\_make\_prefixes:w.)$ 

### 4.5.2 Patching by retokenization

At this point we've drained the possibilities of patching a command by expansion-and-redefinition, so we have to resort to patching by retokenizing the command. Patching by retokenization is done by getting the \meaning of the command, doing the necessary manipulations on the generated string, and the retokenizing that again by using \scantokens.

Patching by retokenization is definitely a riskier business, because it relies that the tokens printed by \meaning produce the exact same tokens as the ones in the original definition. That is, the catcode régime must be exactly(ish) the same, and there is no way of telling except by trial and error.

This is the macro that will control the whole process. First we'll try out one final, rather trivial case, of a command with no arguments; that is, a token list. This case can be patched with the expand-and-redefine routine but it has to be the very last case tested for, because most (all?) robust commands start with a top-level macro with no arguments, so testing this first would short-circuit \robust@command@act and the top-level macros would be incorrectly patched. In that case, we just check if the \cs\_argument\_spec:N is empty, and call \\_\_hook\_patch\_expand\_redefine:NNnn.

Otherwise, we start the actual patching by retokenization job. The code calls \\_\_hook\_try\_patch\_with\_catcodes:Nnnnw with a different catcode setting:

- The current catcode setting;
- Switching the catcode of @;
- Switching the expl3 syntax on or off;

\_hook\_retokenize\_patch:Nnn

• Both of the above.

If patching succeeds, \\_hook\_try\_patch\_with\_catcodes: Nnnnw has the side-effect of patching the macro #1 (which may be an internal from the command whose name is #2).

```
\tl_set:Nx \l__hook_tmpa_tl
                \int_compare:nNnTF { \char_value_catcode:n {'\@ } } = { 12 }
                  { \exp_not:N \makeatletter } { \exp_not:N \makeatother }
190
              }
191
            \tl_set:Nx \l__hook_tmpb_tl
192
              {
193
                \bool_if:NTF \l__kernel_expl_bool
194
                  { \ExplSyntaxOff } { \ExplSyntaxOn }
195
              }
196
            \use:x

                  \q_recursion_tail \q_recursion_stop
```

If no catcode setting succeeds, give up and raise an error. The command isn't changed in any way in that case.

 $(End\ definition\ for\ \verb|\__hook_retokenize_patch:Nnn.|)$ 

\\_hook\_try\_patch\_with\_catcodes:Nnnnw

This function is a simple wrapper around  $\_\$ \_hook\_cmd\_if\_scanable:NnTF and  $\_\$ \_hook\_patch retokenize:Nnnn if the former returns  $\langle true \rangle$ , plus some debug messages.

```
\cs_new_protected:Npn \__hook_try_patch_with_catcodes:Nnnnw #1 #2 #3 #4
216
    {
       \quark_if_recursion_tail_stop_do:nn {#4} { \use:n }
218
       \__hook_patch_debug:x { ++~trying~to~patch~by~retokenization }
219
       \__hook_cmd_if_scanable:NnTF {#1} {#4}
           \__hook_patch_debug:x { ++~macro~can~be~retokenized~cleanly }
           \_hook_patch_debug:x { ==~retokenizing~macro~now }
           \_hook_patch_retokenize:Nnnn #1 {#2} {#3} {#4}
224
           \use_i_delimit_by_q_recursion_stop:nw \use_none:n
         }
226
           \__hook_patch_debug:x { --~macro~cannot~be~retokenized~cleanly }
228
```

\kerneltmpDoNotUse

This is an oddity required to be safe (as safe as reasonably possible) when patching the command. The entirety of

```
\langle prefixes \rangle \setminus \{cs\} \langle parameter\ text \rangle \{\langle replacement\ text \rangle \}
```

will go through \scantokens. The  $\langle parameter\ text \rangle$  and  $\langle replacement\ text \rangle$  are what we are trying to retokenize, so not much worry there. The other items, however, should "just work", so some care is needed to not use too fancy catcode settings. Therefore we can't use an expl3-named macro for  $\langle cs \rangle$ , nor the expl3 versions of \def or the  $\langle prefixes \rangle$ . That is why the definitions that will eventually go into \scantokens will use the oddly (but hopefully clearly)-named \kerneltmpDoNotUse:

```
232 \cs_new_eq:NN \kerneltmpDoNotUse !
```

PhO: Maybe this can be avoided by running the \( \parameter \text \) and the \( \text{replacement} \) text\\ separately through \( \scantokens \) and then putting everything together at the end.

\ hook patch required catcodes:

Here are the catcode settings that are mandatory when retokenizing commands. These are the minimum necessary settings to perform the definitions: they identify control sequences, which must be escaped with  $\downarrow_0$ , delimit the definition with  $\{_1 \text{ and } \}_2$ , and mark parameters with  $\#_6$ . Everything else may be changed, but not these.

PhO: etoolbox sets the \endlinechar and \newlinechar when patching, but as far as I tested these didn't make much of a difference, so I left them out for now. Maybe \newlinechar=-1 avoids a space token being added after the definition.

PhO: If the patching is split by  $\langle parameter\ text \rangle$  and  $\langle replacement\ text \rangle$ , then only # will have to stay in that list.

PhO: Actually now that we patch \UseHook{cmd/foo/before}, all the tokens there need to have the right catcodes, so this list now includes all lowercase letters, U and H, the slash, and whatever characters in the command name...sigh...

(End definition for \\_\_hook\_patch\_required\_catcodes:.)

\\_\_hook\_cmd\_if\_scanable:Nn<u>TF</u>

Here we'll do a quick test if the command being patched can in fact be retokenized with the specific catcode setting without changing in meaning. The test is straightforward:

- 1. apply \meaning to the command;
- 2. split the  $\langle prefixes \rangle$ ,  $\langle parameter\ text \rangle$  and  $\langle replacement\ text \rangle$  and arrange them as

- 3. rescan that with the given catcode settings, and do the definition; then finally
- 4. compare \kerneltmpDoNotUse with the original command.

If both are \ifx-equal, the command can be safely patched.

```
242 \prg_new_protected_conditional:Npnn \__hook_cmd_if_scanable:Nn #1 #2 { TF }
243
       \cs_set_eq:NN \kerneltmpDoNotUse \scan_stop:
244
       \cs_set_eq:NN \__hook_tmp:w \scan_stop:
245
       \use:x
246
         {
247
           \cs_set:Npn \__hook_tmp:w
248
               ####1 \tl_to_str:n { macro: } ####2 -> ####3 \s_hook_mark
249
             { ####1 \def \kerneltmpDoNotUse ####2
250
           \tl_set:Nx \exp_not:N \l__hook_tmpa_tl
251
             { \exp_not:N \__hook_tmp:w \token_to_meaning:N #1 \s__hook_mark }
253
       \tl_rescan:nV { #2 \__hook_patch_required_catcodes: } \l__hook_tmpa_tl
254
       \token_if_eq_meaning:NNTF #1 \kerneltmpDoNotUse
255
         { \prg_return_true: }
256
         { \prg_return_false: }
257
    }
258
```

 $(End\ definition\ for\ \_\ book\_cmd\_if\_scanable:NnTF.)$ 

 $\verb|\__hook_patch_retokenize:Nnnn|$ 

Then, if  $\_\$  hook\_cmd\_if\_scanable:NnTF returned true, we can go on and patch the command.

```
259 \cs_new_protected:Npn \__hook_patch_retokenize:Nnnn #1 #2 #3 #4
```

Start off by making some things \relax to avoid lots of \noexpand below.

```
cs_set_eq:NN \kerneltmpDoNotUse \scan_stop:
cs_set_eq:NN \__hook_tmp:w \scan_stop:
use:x
{
```

Now we'll define  $\_\$  we such that it splits the  $\$  meaning of the macro (#1) into its three parts:

```
####1. \langle prefixes \rangle
####2. \langle parameter text \rangle
####3. \langle replacement text \rangle
```

and arrange that a complete definition, then place the before or after hooks around the  $\langle replacement\ text \rangle$ : accordingly.

```
\tag{cs_set:Npn \__hook_tmp:w}
\tag{####1 \tl_to_str:n \{ macro: \} ####2 -> ####3 \s__hook_mark\\
\tag{c6}
\tag{####1 \def \kerneltmpDoNotUse ####2}
\tag{c6}
\tag{c70}
\tag{str_if_eq:nnT \{#3\} \{ before \}}
\tag{\token_to_str:N \UseHook \{ cmd \/ #2 \/ #3 \} \}
```

Now we just have to get the \meaning of the command being patched and pass it through the meat grinder above.

Now rescan with the given catcode settings (overridden by the \\_hook\_patch\_-required\_catcodes:), and implicitly (by using the rescanned token list) carry out the definition from above.

```
\ \tl_rescan:nV { #4 \__hook_patch_required_catcodes: } \l__hook_tmpa_tl And to close, copy the newly-defined command into the old name and the patching is finally completed:
```

```
281 \cs_set_eq:NN #1 \kerneltmpDoNotUse
282 }
(End definition for \__hook_patch_retokenize:Nnnn.)
```

The command \\_\_hook\_cmd\_begindocument\_code: is used in an internal hook, so we need to make sure it has a harmless definition after rollback as that will not remove it from the kernel hook.
